# JS & DOM Reference Window opener Property

# <u> Window Object</u>

# Definition and Usage

The opener property returns a reference to the window that created the window.

When opening a window with window.open(), you can use this property from the destination window to return details of the source (parent) window.

Coding Tip: window.opener.close() will close the source (parent) window.

# Syntax

window.opener

# **Browser Support**

The opener property is supported in all major browsers.

# Example

### Example

Write some text to the source (parent) window:

```
<html>
<head>
<script type="text/javascript">
function openWin()
{
myWindow=window.open('','','width=200,height=100');
myWindow.document.write("This is 'myWindow'!");
myWindow.focus();
myWindow.opener.document.write("This is the source window!");
</script>
</head>
<body>
<input type="button" value="Open 'myWindow'" onclick="openWin()" />
</body>
</html>
```
