JavaScript fontcolor() Method

📁 JavaScript String Object

Definition and Usage

The fontcolor() method is used to display a string in a specified color.

This method returns the string embedded in the tag, like this:

string

Syntax

```
string.fontcolor(color)
```

Parameter	Description
color	Required. A color value. The value can be a color name (e.g. red), an RGB value (e.g. rgb(255,0,0)), or a hex number (e.g. #FF0000)

Browser Support

The fontcolor() method is supported in all major browsers.

Example

Example
Display the text in green:

```
<script type="text/javascript">

var str = "Hello world!";
document.write(str.fontcolor("green"));

</script>
```
