Window frames Property

📁 Window Object

Definition and Usage

The frames property returns an array of all the frames (including iframes) in the current window.

Tip: Use frames.length to find the number of frames.

Syntax

```
window.frames
```

Browser Support

The frames property is supported in all major browsers.

Example

Example

Find the number of frames on a page, and change the src property of every frame element to "w3schools.com":

```
<html>
<body>

<iframe src="http://microsoft.com"></iframe>
<iframe src="http://google.com"></iframe>
<iframe src="http://youtube.com"></iframe>

<script type="text/javascript">
for (var i=0; i<frames.length; i++)
  {
  frames[i].location="http://w3schools.com"
  }
</script>

</body>
</html>
```
